

Back to [Linguistic Research Infrastructure](#) (LiRI)

Linguistic Application Development

One of the [Language Technology](#) group's core competencies is the development of custom-made applications. Most applications we have developed to date are either made to let users explore language data in interactive ways using innovative visualization techniques, or to serve as annotation tools. Our expertise comprises:

- Workflow applications for the management and annotation of linguistic data
- Exploration of language data collections
- Ready-made scientific tools for university and industry
- Technology transfer to scale to real-world data
- Interactive visualization techniques
- Analysis of data over space and time (geospatial data, diachronic corpora)
- Annotation tools and interfaces
- Web applications for Public Engagement, Crowd Sourcing, and Citizen Science
