

VIAN-DH

VIAN-DH is web-based software for multimodal corpora. It is a part of LiRI Corpus Platform (LCP), specializing in audio-visual language resources.

Corpora stored in VIAN-DH containing different types of annotations. To name some of them, annotations can include speech transcript, part-of-speech annotation and other kinds of labels marking embodied communication, such as gestures or facial expressions, or document segmentation such as scene for film, turn for conversations, or experiment phase for various experimental settings. This is not an exhaustive list, and the scope of annotations varies from one corpus of another.

VIAN-DH allows for different types of alignment. Primary types are:

- time-frame alignment for any annotations linked to the time or frame stream
- text-alignment referring to continuous stream of characters for annotations referring to textual content, such as part-of-speech, named-entity-recognition, etc.

Any annotation can have multiple alignment to both of these streams by marking its start and end position/index, e.g., a sentence can have a start and end time and a start and end character. See the image below for a graphical representation of data being linked to multiple alignment streams.

The LiRI Lab is equipped with a wide array of equipment for investigating any aspect of language. As well as the lab itself we also operate an equipment loan service. You can find more information about the lab and the equipment available below.
